#### 1.0 NARRATIVE CONCEPTUAL MODEL

## 1.1 Regional Description

Washoe County is located in the northwest portion of Nevada. It is bounded by California, Oregon, and the Nevada counties of Humboldt, Pershing, Storey, Churchill, Lyon, and Carson City (Figure 1.1). The Truckee Meadows is approximately 200 square miles in size and situated in the southern portion of Washoe County. It is geographically identified as Hydrographic Area 87 (HA 87) as defined by the State of Nevada, Division of Water Resources. Most of Washoe County's population lives in and around the Truckee Meadows.

The Truckee Meadows sits at an elevation of 4,400 feet above sea level and surrounded by mountain ranges. To the west, the Sierras rise to elevations of 9,000 to 11,000 feet. Hills to the east reach 6,000 to 7,000 feet. The Truckee River, flowing from the Sierras eastward, drains into Pyramid Lake to the northeast of the Truckee Meadows.

Average annual wind speed measured at the Reno-Tahoe International Airport is 6.4 mph. January is the calmest month (4.5 mph) with April being the windiest (8.3 mph). Wintertime (November-January) averages 4.9 mph and summertime (June-August) averages 7.2 mph.

Most of Reno's precipitation falls from November through March in the form of rain and snow. Reno receives an average of 7.40 inches of precipitation per calendar year (1981-2010

Figure 1.1

Washoe County, Nevada

climate normals). Table 1.1 lists temperature and precipitation normals as measured at the Reno-Tahoe International Airport.

Table 1.1: Monthly Normal Temperature and Rainfall (1981-2010)

|           | Т       | Precipitation (inches) |        |        |
|-----------|---------|------------------------|--------|--------|
| Month     | Maximum | Minimum                | Normal | Normal |
| January   | 45.7    | 25.4                   | 35.6   | 1.03   |

| May       | 73.5    | 45.5                   | 59.5   | 0.49   |
| June      | 83.3    | 52.0                   | 67.7   | 0.51   |
| July      | 92.2    | 57.7                   | 74.9   | 0.18   |
| August    | 90.6    | 55.8                   | 73.2   | 0.23   |
| September | 82.0    | 48.5                   | 65.2   | 0.35   |
| October   | 69.2    | 38.8                   | 54.0   | 0.51   |
| November  | 55.0    | 30.5                   | 42.7   | 0.82   |
| December  | 45.6    | 25.0                   | 35.3   | 1.03   |

The 2014 population of Washoe County was 436,797. Approximately 66 percent of Washoe County's residents live in the Truckee Meadows, which includes the cities of Reno and Sparks. Anthropogenic activities such as transportation, manufacturing, freight distribution, and residential wood use are also concentrated in the Truckee Meadows.

Washoe County experiences two distinct air pollution seasons – wintertime particulate matter (PM) and summertime ozone  $(O_3)$ . Wildfire smoke throughout the year, especially during the summer months, can dramatically increase summertime PM and ozone.

Wintertime temperature inversions combined with light winds can contribute to elevated levels of Particulate Matter less than or equal to 2.5 microns ( $PM_{2.5}$ ), Particulate Matter less than or equal to 10 microns ( $PM_{10}$ ), Nitrogen Dioxide ( $NO_2$ ), and Carbon Monoxide ( $NO_2$ ). Inversions are common in mountain valleys such as the Truckee Meadows. Air pollution episodes persist until stronger winds scour the cold air out of the valley and break the temperature inversion.

Northern Nevada receives an abundant amount of sunshine and solar radiation during the summer months. Mobile sources (i.e., cars and trucks) emit ozone precursors and their activity increases during the summer. Ozone concentrations are typically highest between May through September, especially during the months of June, July, and August.

Strong winds can occur at any time of year. 2-minute gusts over 40 mph are not uncommon. These winds lower the gaseous pollutant ( $O_3$ , CO,  $NO_2$ , and  $SO_2$ ) concentrations, but typically increase PM levels, especially  $PM_{10}$ . Hourly  $PM_{10}$  levels can reach more than  $500 \, \mu g/m^3$  for several hours.

All areas of Washoe County currently attain the National Ambient Air Quality Standards (NAAQS) for all pollutants and averaging times. However, portions of Washoe County have been designated non-attainment for the following NAAQS: 1) 1971 Total Suspended Particles (TSP) (24-hour and Annual); 2) CO (8-hour); 3) 1979 ozone (1-hour); and 4) 1987 PM<sub>10</sub> (24-hour and Annual). Control strategies since the 1970's targeting mobile sources, woodstoves, and dust control have reduced emissions and improved air quality.

### 1.2 Overview of Ambient Air Monitoring Network

In 2015 the Washoe County Health District Air Quality Management Division (AQMD) operated 7 ambient air monitoring sites in Washoe County (Figure 1.2). The blue boundary delineates HA 87 as defined by the State of Nevada, Division of Water Resources. Table 1.2 lists the parameters monitored in 2015, sorted by site.

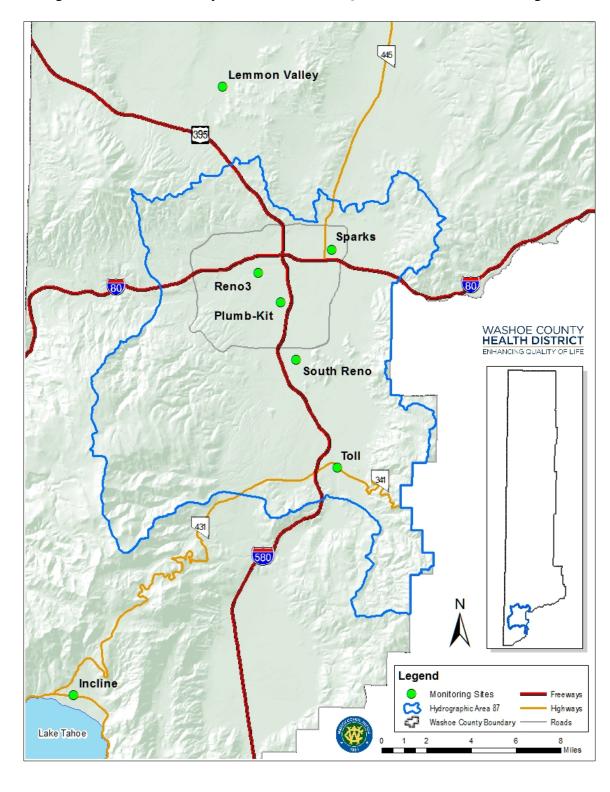

Figure 1.2: Washoe County Health District - AQMD Ambient Air Monitoring Sites

The AQMD's ambient air monitoring network meets the minimum monitoring requirements for all criteria pollutants pursuant to Title 40 Part 58 of the Code of Federal Regulations (CFR), Appendix D. Washoe County's monitoring network is reviewed annually pursuant to 40 CFR 58.10 to ensure the network meets the monitoring objectives defined in 40 CFR 58, Appendix D (See Appendix A for the Region IX of the U.S. Environmental Protection Agency (EPA) Annual Network Plan Approval Letter). Data was collected and quality assured in accordance with 40 CFR 58 and submitted to the Air Quality System (AQS). Additionally, 2015 data was certified on April 22, 2016, and the Data Certification Letter was submitted to EPA Region IX on April 22, 2016 (See Appendix B).

#### 1.3 Characteristics of Non-Event Ozone Formation

Ozone is formed from a chemical reaction between nitrogen oxides and volatile organic compounds in the presence of sunlight. Mobile Sources (On-Road and Non-Road) are the largest categories of ozone precursors. Figure 1.3 illustrates the ozone planning inventory which represents Nitrogen Oxide (NOx) and Volatile Organic Carbon (VOC) emissions for a typical summer day.

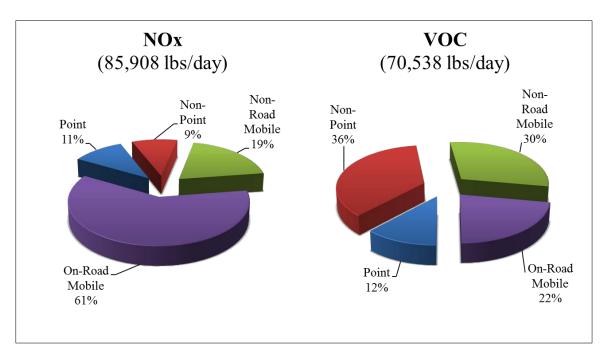

Figure 1.3: NOx and VOC Emissions for a Typical Day in Summertime

Based on historic, non-event ozone monitoring data for the previous six years, below are the characteristics of ozone levels throughout the year in the Truckee Meadows.

- 1. <u>January through March</u>: This is generally the period with the lowest ozone concentrations during the year because of the cooler temperatures, shorter days, and unsettled weather patterns.
- 2. April through May: This is a transitional period between spring and summer. 8-hour ozone concentrations above 65 ppb are unusual. Infrequently, meteorological conditions (specifically from late April to early June) are favorable for ozone formation in Northern/Central California followed by stronger than normal west-southwesterly winds conducive to interstate transport of existing pollution downwind towards the Reno/Sparks area.
- 3. <u>June through August</u>: The highest ozone levels are typically observed during these summer months. Mobile Source activity, including Vehicle Miles Traveled (VMT), peaks during the summer. Afternoon winds, also known as the Washoe Zephyr, typically keep ozone concentrations from reaching NAAQS levels. These are the months where wildfire smoke and secondary ozone impacts are most likely to occur. Historic (2010-2015) 8-hour statistics at the Reno3 (AQS ID 32-031-0016) station are listed below (Table 1.3).

Table 1.3: Historic 8-hour Ozone Concentrations at Reno3

| Percentile | Concentration (ppm) |
|------------|---------------------|
| 100        | 0.075               |
| 99         | 0.073               |
| 95         | 0.068               |
| 50         | 0.055               |

- 4. <u>September through October</u>: Ozone concentrations typically begin to decrease as mobile source activity, temperatures, and solar radiation also decrease. Wildfire smoke and secondary ozone impacts can still be observed during this period.
- 5. <u>November through December</u>: Ozone concentrations are typically low during these months because of cooler temperatures and shorter days.

Figure 1.4 illustrates the typical summertime (June-August) diurnal ozone pattern at the Reno3 monitoring site. These patterns are based on historic ozone data from 2010 to 2015.

Figure 1.4: Typical Summertime 1-hour Ozone Diurnal Pattern at Reno3

#### 2.0 EXCEPTIONAL EVENT SUMMARY

# 2.1 Exceptional Events Definition and Demonstration Criteria

On [October 3, 2016], the EPA finalized revisions to the "Treatment of Data Influenced by Exceptional Events", regulations that govern the exclusion of event-influenced air quality data from certain regulatory decisions under the Clean Air Act (CAA) Section 319(b). This rule is known as the Exceptional Events Rule (EER). The EER contains definitions, procedural requirements, requirements for air agency demonstrations, and criteria for EPA approval for the exclusion of air quality data from regulatory decisions. The EER states that the EPA has the authority to exclude air quality monitoring data from regulatory determinations related to exceedances or violations of the NAAQS and avoid designating an area as nonattainment, redesignating an area as nonattainment, or reclassifying an existing nonattainment area to a higher classification if a State adequately demonstrates that an exceptional event has caused an exceedance or violation of a NAAQS. The CAA includes four requirements that, collectively, define an exceptional event:

- 1. The event affected air quality,
- 2. The event was not reasonably controllable or preventable,
- 3. The event was caused by human activity that is unlikely to recur at a particular location or was a natural event,
- 4. There exists a clear causal relationship between the specific event and the monitored exceedance.

EPA regulations in 40 CFR 50.14(c)(3)(iv) states that exceptional events demonstrations must address and include the following elements:

- 1. A narrative conceptual model;
- 2. A demonstration that the event was both not reasonably controllable and not reasonably preventable;
- 3. A demonstration that the event was a human activity unlikely to recur at a particular location or was a natural event; and
- 4. A demonstration that the event affected air quality in such a way that there exists a clear causal relationship between the specific event and the monitored exceedance.

# 2.2 Statement of Purpose

On August 21, 2015, the AQMD monitored an exceedance of the 2015 8-hour  $O_3$  NAAQS at the Reno3 air quality monitoring site due to smoke plume impacts from several wildfires in California. The AQMD has determined that the 2015 California Wildfires influenced  $O_3$  concentrations exceeding the 2015 NAAQS on August 21, 2015 and qualify as an exceptional event under Title 40, Part 50 of the Code of Federal Regulations (40 CFR 50), EER. The purpose of this document is to petition the Regional Administrator for EPA Region IX to exclude air quality monitoring data for  $O_3$  from the normal planning and regulatory requirements under the CAA in accordance with the EER. This demonstration package will have a regulatory impact on the 2015 8-hour  $O_3$  designation for Washoe County.

The following demonstration package will define the exceptional event and justify data exclusion according to the CAA 319(b) and the revised EER (40 CFR 50.14(c)(3)(iv). The analysis will address these definitions and provide documentation to establish that the 2015 California Wildfires quality as an exceptional event. Specifically, that the event affected air quality by demonstrating that: 1) the event was not reasonably controllable or preventable, 2) the event was a natural event, 3) there was a clear causal relationship between the 8-hour O<sub>3</sub> concentrations in Washoe County and the event. An Exceptional Events Initial Notification was sent to EPA Region IX on Tuesday, May 10, 2016 (see Appendix C). This exceptional event demonstration underwent public comment from October 1 to October 31, 2016 (See Appendix D).

### 2.3 Summary of Event

The 2015 fire season in California was above the 10 year average with 8,745 fires and 893,362 acres burned reported by all agencies. The 10 year average is 7,971 fires with 673,446 acres burned. Of the 8,745 fires, 273 were greater than 10 acres. On August 18, 2015, smoke from numerous lightning caused wildfires throughout California began to impact the Reno/Sparks area. Smoke plume impacts continued to affect the Reno/Sparks area throughout August. Between August 18 and August 21, 2015, the AQMD monitored 9 exceedances of the 2015 8-hour O<sub>3</sub> NAAQS and 2 exceedances of the 24-hour PM<sub>2.5</sub> NAAQS across its air quality monitoring network due to the smoke plume impacts. The PM<sub>2.5</sub> concentrations due to the smoke plume impacts were highest on August 21, 2015. The AQMD is requesting exclusion of the 8-hour O<sub>3</sub> concentration from Reno3 on August 21, 2015 due to the increase in PM<sub>2.5</sub> causing an exceedance of the O<sub>3</sub> NAAQS.

Figure 2.1 shows the location, start date, containment, and acres burned on August 21, 2015. Figures 2.2 and 2.3 show the satellite image of the wildfire smoke plume traveling from the Complex Fires into the Reno/Sparks area on August 20-21, 2015. The Reno/Sparks area was mostly impacted from the Complex Fires (Fork, Mad River, South, Route, and River Complex) as well as from the Gasquet Complex and Nickowitz fires north of the Complex Fires. Figures 2.4 through 2.6 show the perimeter of the Complex Fires. Perimeter maps were not available for the Gasquet Complex and Nickowitz Fires.

#### 2.4 Event Related Concentrations

On August 21, 2015 the AQMD monitored 4 exceedances of the 8-hour O<sub>3</sub> NAAQS, with the highest concentration reaching 0.073 parts per million (ppm). Wildfire smoke and ozone precursors from the California Complex Fires were transported east across into Nevada on prevailing winds, ozone concentrations elevated across northern California and Nevada, resulting in the O<sub>3</sub> exceedance at the Reno3 monitoring site. Elevated PM<sub>2.5</sub> and NOx concentrations support the presence of wildfire smoke. Section 2.5 further describes the meteorological conditions experienced during the event.

Table 2.1 lists  $O_3$  concentrations across the ambient air monitoring network seven days before and after the August 21, 2015 event. It highlights the elevated concentrations and exceedance at the Reno3 site during the event.

Figure 2.7 shows the  $PM_{2.5}$ ,  $O_3$ , and NOx concentrations at the Reno3 site seven days before and after the August 21, 2015 event. These pollutants were elevated, especially on August 21. This supports the demonstration that the increase in wildfire smoke also increased NOx concentrations, which increased  $O_3$  levels.

Figure 2.8 shows O<sub>3</sub> and PM<sub>2.5</sub> concentrations at all other monitoring sites. The elevated concentrations throughout the monitoring network demonstrate that the wildfire smoke impacts were regional and consistent with dispersion from fires over 200 kilometers (km) away.

In this exceptional event demonstration, AQMD is requesting to exclude all hourly  $O_3$  data from the Reno3 monitoring site for August 21, 2015 from 0000 Pacific Standard Time (PST) to 2300 PST from comparison to the NAAQS. Exclusion of the data caused by this exceptional event will have a regulatory impact on the attainment designation of the 2015 8-hour  $O_3$  NAAQS.

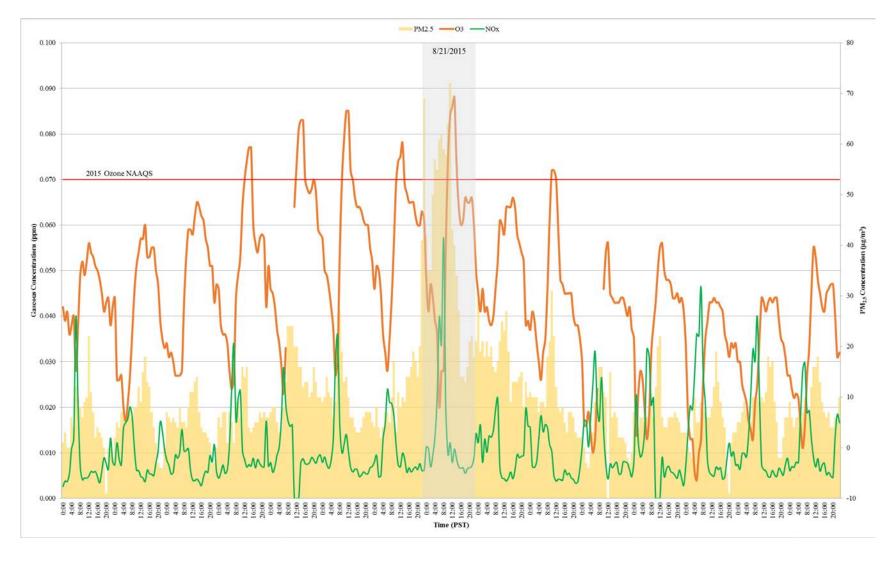

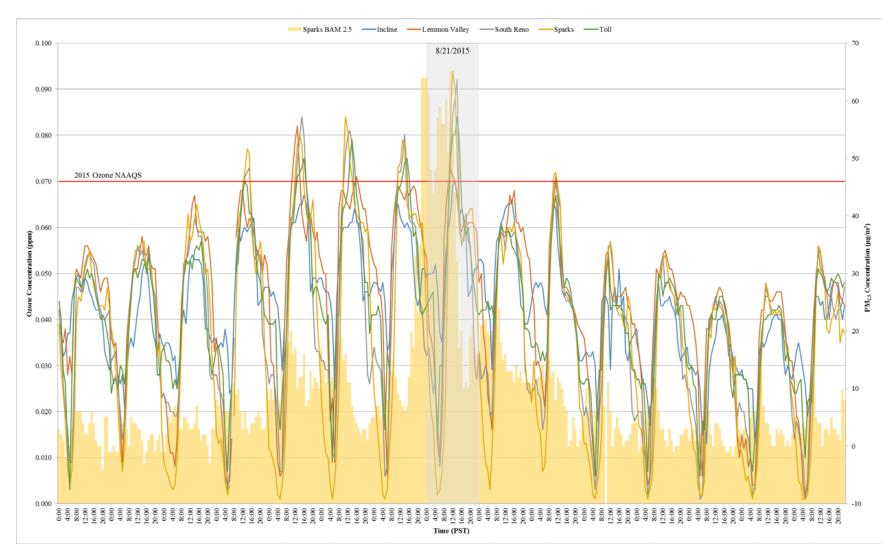

Figure 2.7: Reno3 Ozone, NOx, and PM<sub>2.5</sub> Hourly Concentrations for August 14-28, 2015

# 2.5 Meteorological Conditions

In Nevada, the primary summer months of July, August, and September are typically dominated by a large synoptic scale high pressure system over the western states. At times, this high-pressure system is seasonally located over the four-corners area (Arizona, New Mexico, Colorado, and Utah) producing southerly or southeasterly winds, which bring subtropical moisture into the southwestern deserts and often into northern Nevada. Such flows produce thunderstorms and rain, and sometimes hail and gusty winds, and are commonly referred to as the "monsoon season."

During the period of August 17-21, 2015, when smoke from northern California fires moved eastward into northern and northwestern Nevada, the typical high-pressure system moved westward and was located generally near southern California. Such a position reverses the prevailing winds aloft from southerly/southeasterly to westerly or northwesterly.

Figures 2.9 through 2.13 show the weather maps for 4:00 am PST each day from August 17 through August 21, 2015. There are several things to note. First of all, the position of the upper level high pressure system near southern California producing weak westerly or northwesterly upper level winds but showing progressively stronger influence in time over this period. Secondly, surface maps are similar across the period with surface thermal lows near Las Vegas and extending across the central valley of California into northern California. Such situations generally produce light and often variable surface wind conditions. Thirdly, the precipitation maps show no precipitation over any portion of Nevada or California during this entire period.

In the desert portions of Northern Nevada, visibilities are typically very good. Reductions in summertime visibility to levels below 10 miles only occur in the summer under three conditions: 1) heavy rain from thunderstorms; 2) blowing dust from thunderstorm downdrafts that can cause winds to exceed 50 mph at times; and 3) smoke from wildfires.

# 2.6 Meteorological Assessment of Smoke Influence in Northwestern Nevada

The fires in northern California have been well documented. It is not the intent here to provide further documentation of those fires but rather to illustrate the significant influence of the smoke plumes in northwestern Nevada toward the latter part of the period.

Since there were no thunderstorms during this period, any reductions in visibility over wide areas would be convincing evidence of smoke plume impacts. Visibilities are typically recorded using standard procedures at airports. In this analysis, four airport locations were used: Sacramento (an upwind location), Reno, Lovelock, and Fallon Naval Air Station.

Hourly visibility readings were plotted and are shown in Figure 2.14. Although maximum visibilities can well exceed 10 miles, especially in the deserts, standard visibility reporting procedures put the maximum reportable value at 10 miles. Anything below 10 miles connotes a visibility-reducing event.

Figure 2.14 reveals some very interesting features. Sacramento, nearest to the Jerusalem Fire, was impacted on the August 17 and 18, 2015 with reduced visibilities, but thereafter did not have any hour below 10 miles, except for 3:00 am on the August 21, when the visibility dropped to 9 miles.

If the smoke traveled from west to east across the Sierras, it would follow that visibilities would be affected at locations sequentially from west to east. That is not the case in this situation. Visibility reductions on the August 18 occurred initially at Fallon -- the south easternmost airport of the three Nevada airports plotted. For this to occur, one of two scenarios are possible: 1) the smoke plume was aloft over Reno and Lovelock and mixed to the ground by the time it reached Fallon. Or 2), and more likely, the plume moved eastward from extreme northern California into extreme northern Nevada, and then moved in a southeasterly direction affecting Fallon before Lovelock or Reno.

On the August 19, greater smoke impacts as depicted by even lower visibilities down to 7 miles at times, occurred at both Fallon and Lovelock, indicating the plume was moving more directly southeasterly such that both locations were in the path of the plume.

On the August 20, visibility reductions at Lovelock went down to 6 miles during the day and further down to 4 miles by the end of the day. At Fallon, visibility was below 6 miles for much of the afternoon hours but had a brief increase late evening, suggesting variability in the plume density. Also, late in the evening, Reno showed the first indications of visibility below 10 miles.

August 21 indicates a broad, widespread smoke event over most of northwestern Nevada. Reno visibility was below 10 miles for most of the day, improving in the evening. Minimum visibility was down to 4 miles for several hours beginning in the morning and continuing into the afternoon. At Lovelock, visibility was below 10 miles all day, except for one hour late in the evening. Lowest visibilities were at 2 miles for two hours in the afternoon, indicating very dense smoke impacts for much of the day, and then steadily improving in the evening. The lowest visibilities were monitored at Fallon, where visibilities were at 2 miles for five consecutive

hours, and 4 miles or less for most of the day, then improving considerably in the evening, suggesting the end of the smoke episode.

From a meteorological perspective, using visibility as a reasonable surrogate for smoke density, Fallon was the most impacted by the northern California smoke plume, with visibility impacts noted on the last four of the five days analyzed. Lovelock was next most impacted, showing reduced visibilities on the last three days analyzed. Reno was impacted most notably on August 21, with smoke impacts, from a visibility perspective beginning late on the August 20. Figure 2.15 shows Lovelock and Fallon in relationship to Reno.

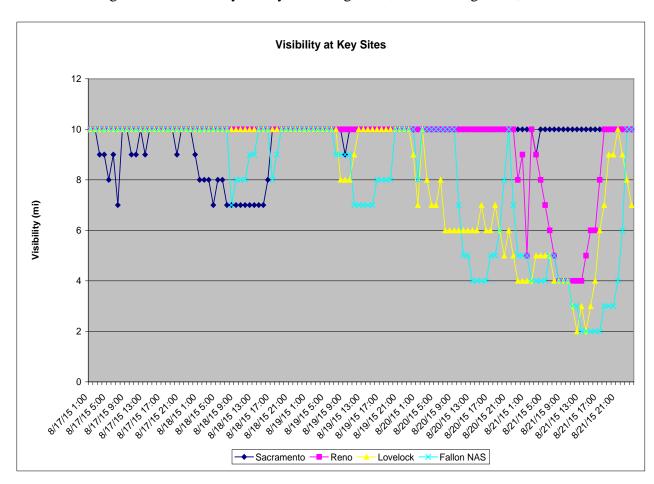

Figure 2.14: Visibility at Key Sites August 17, 2015 to August 21, 2015

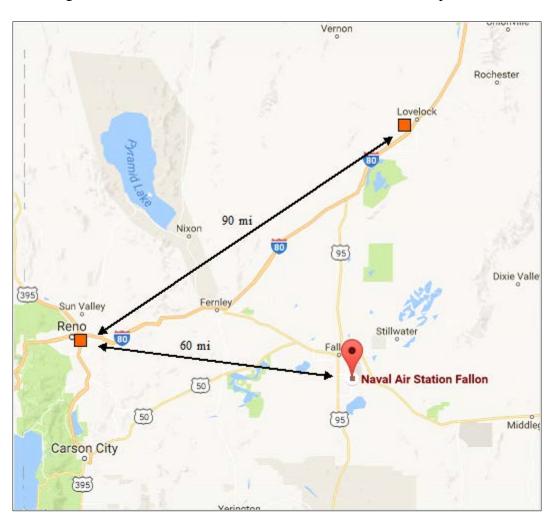

Figure 2.15: Location of Lovelock and Fallon in Relationship to Reno

Below is an Area Forecast Discussion from the National Weather Service issued August 21, 2015.

AREA FORECAST DISCUSSION

NATIONAL WEATHER SERVICE RENO NV

322 AM PDT FRI AUG 21 2015

.SYNOPSIS...

DRY CONDITIONS WITH ABOVE NORMAL TEMPERATURES WILL CONTINUE THROUGH THIS WEEKEND. AFTERNOON ZEPHYR BREEZES ARE EXPECTED FOR THE NEXT FEW DAYS, EXCEPT FOR LIGHTER WINDS ON SATURDAY. HAZE AND SMOKE FROM LARGE WILDFIRES IN CALIFORNIA AND THE PACIFIC NORTHWEST WILL DRIFT ACROSS THE REGION FOR THE NEXT FEW DAYS. A COOLING TREND WITH BREEZY CONDITIONS IS LIKELY LATER NEXT WEEK.

.SHORT TERM...

DRY WEATHER PATTERN WILL CONTINUE THROUGH THIS WEEKEND WITH FEW CHANGES MADE TO THE ONGOING FORECAST. SHORTWAVE MOVING FROM SOUTHWEST CANADA TO MONTANA WILL BRING ZEPHYR-TYPE BREEZES ACROSS MOST AREAS THIS AFTERNOON. GUSTS MAY BRIEFLY EXCEED 30 MPH IN A FEW LOCATIONS OF WESTERN NV NORTH OF HIGHWAY 50 AND FAR NORTHEAST CA. AS RIDGE BUILDS IN SATURDAY, LIGHTER WINDS ARE EXPECTED, FOLLOWED BY A RETURN OF ZEPHYR BREEZES WITH GUSTS 25-30 MPH SUNDAY AS THE RIDGE CENTER MOVES EAST TOWARD THE FOUR CORNERS REGION. TEMPERATURES SHOULD EDGE SLIGHTLY DOWNWARD TODAY, BUT REMAIN ABOVE NORMAL THROUGH THE WEEKEND WITH HIGHS GENERALLY IN THE MID 90S FOR MOST LOWER ELEVATIONS.

SMOKE AND HAZE HAS PERSISTED THROUGH THE OVERNIGHT HOURS GENERALLY FROM TRUCKEE-CARSON CITY-FALLON NORTHWARD TO THE OREGON BORDER.

OBSERVATIONS IN THESE AREAS HAVE REPORTED VISIBILITY DOWN TO 4-5

MILES AND/OR CEILINGS BETWEEN 4000-6000 FEET AGL, DESPITE NO

CLOUD COVER SHOWING UP ON IR SATELLITE. THIS SMOKE SHOULD THIN OUT LATER IN THE MORNING, BUT WIND PATTERNS SIMILAR TO YESTERDAY ARE EXPECTED LATER TODAY. AS A RESULT, WE WOULD EXPECT ANOTHER ROUND OF SMOKE AND HAZE TO MOVE IN ACROSS NORTHEAST CA-NORTHWEST NV THIS AFTERNOON, THEN DRIFT SOUTH TO NEAR HIGHWAY 50 THIS EVENING. SOME SMOKE FROM DIFFERENT FIRES IN EASTERN OREGON-WESTERN IDAHO MAY SPREAD INTO PARTS OF NORTHWEST NV LATER TONIGHT, AS A PERIOD OF NORTH WINDS DEVELOPS BEHIND THE TROUGH PASSAGE.

# 2.7 Media Coverage

The AQMD provided prompt notifications throughout the exceptional event to the public and local media. Air Quality Index (AQI) Forecasts and Air Alerts were distributed daily via EnviroFlash. Air quality information was also available from the AQMD website (OurCleanAir.com), social media (Facebook, Twitter, YouTube), and Air Quality Hotline [(775) 785-4110]. The AQMD provided appropriate measures to protect public health from exceedances or violations of ambient air quality standards caused by the exceptional event by providing health advisories on a daily basis based on the AQI range.

AQMD created Facebook and Twitter pages in June and July 2013, respectively and started YouTube in December 2013. As a part of improving our outreach and educational component of our mission statement, we created these pages to serve as a direct outlet to the public and other entities for the daily air quality index update, winter time burn codes, and emergency situations. Examples of media coverage during the exceptional event are shown in Figures 2.16 through 2.18. For additional media coverage of the exceptional event, see Appendix E.

#### 3.0 CLEAR CAUSAL RELATIONSHIP

#### 3.1 Introduction

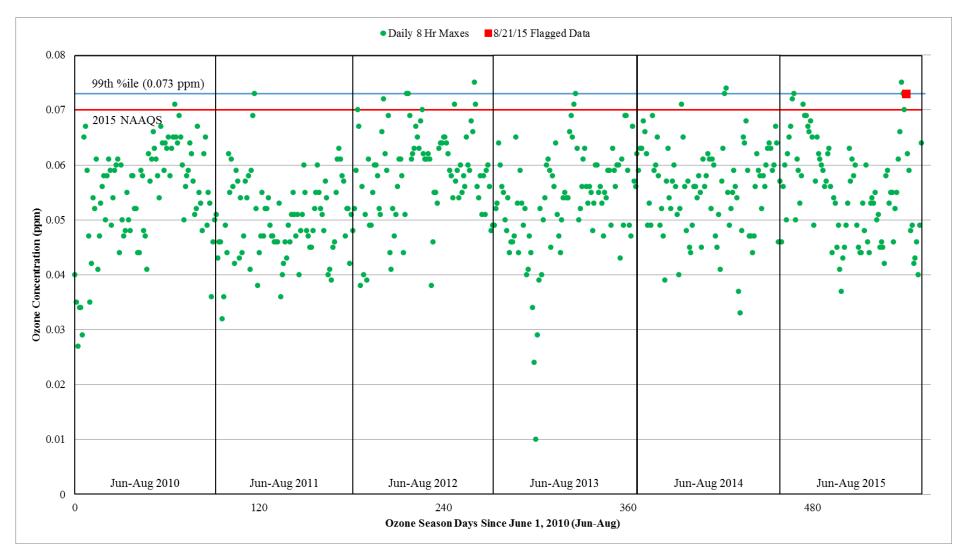

This section of the demonstration addresses the technical element that there is a clear causal relationship between the wildfire event and the monitored exceedance, providing evidence that the event affected air quality. In this section, per the EPA's 2016 EER revision and the Wildfire Ozone Guidance, demonstrations are provided for: 1) a comparison of the  $O_3$  data requested for exclusion against historical  $O_3$  concentrations at the monitor, and 2) the fire's emissions were transported to the monitor and the wildfires emissions affected the monitor.

# 3.2 Comparison of Event-Related Concentrations with Historical Concentrations

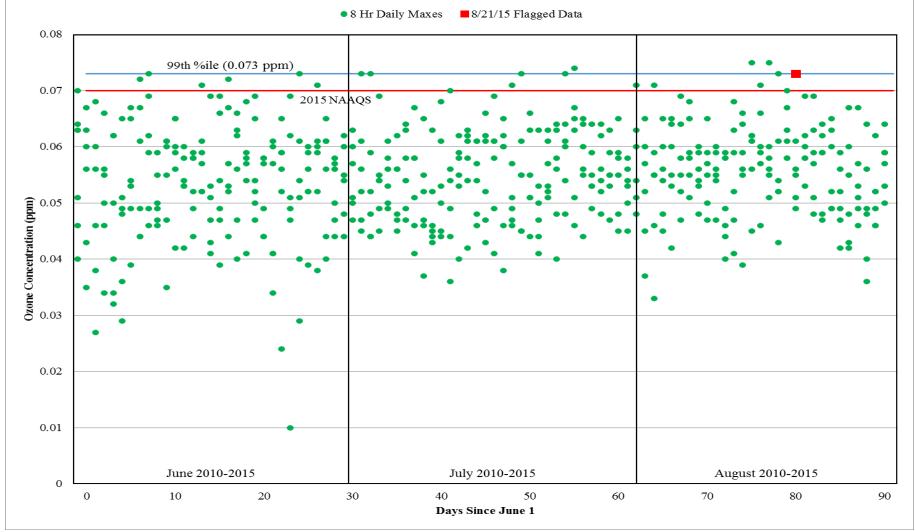

As part of demonstrating a clear causal relationship between the wildfire event and the  $O_3$  exceedance, historical, non-event  $O_3$  season concentrations were compared to the August 21, 2015 event. Graphs of the 5-year historical  $O_3$  seasonal concentrations are shown in Figures 3.1 and 3.2, with the Reno3  $O_3$  exceedance represented as a red square in each figure. The 99<sup>th</sup> percentile value for the  $O_3$  season (June through August), which is the  $O_3$  exceedance during the August 21, 2015 event, is 0.073 ppm.

Figure 3.3 shows the hourly seasonal percentiles for  $O_3$  from 2010-2014 as compared to the concentrations of  $O_3$  formation on August 21, 2015. For five hours, starting at 1000 PST until 1400 PST, the  $O_3$  concentrations were over the 95<sup>th</sup> percentile, with four hours of concentrations at 5-17 ppb higher than non-event related concentrations. This data clearly demonstrates that smoke from the 2015 wildfire events caused an increase in  $O_3$  concentrations at the Reno3 site on August 21, 2015.

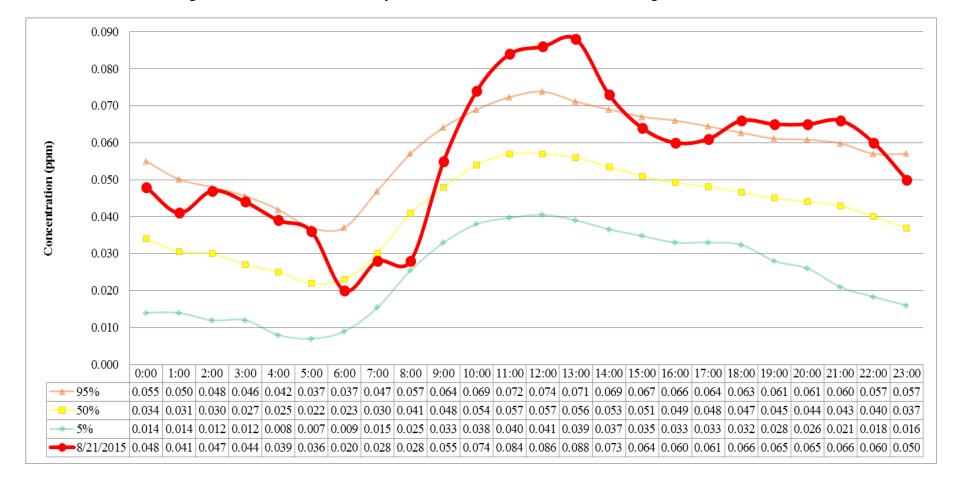

Figure 3.3: Percentiles for Hourly Seasonal Ozone for 2010-2014 with August 21, 2015

# 3.3 Tier 2 Approach

The EPA's Wildfire Ozone Guidance defines a tiering strategy for demonstrations based on the events potential for O<sub>3</sub> formation and the level of evidence required to demonstrate a clear causal relationship between the event and the exceedance. The exceptional event that occurred on August 21, 2015, clearly meets the definition of a Tier 1 demonstration based on the guidance, however, this demonstration will satisfy a Tier 2 approach based on discussions and guidance by EPA Region IX. Specifically, this section provides compelling evidence that: 1) wildfire smoke emissions were transported to the monitor, 2) the wildfire smoke affected the monitor, and 3) emission quantification of the level of wildfire impact at the Reno3 site in the Washoe County monitoring network indicated that the monitored O<sub>3</sub> concentrations exceeded those during non-event related concentrations. Additionally, this section explains in detail the supporting documentation of the two key factors for a Tier 2 demonstration: 1) "Fire emissions and distance of fire(s) to affected monitoring site locations(s)", and 2) "Comparisons of the event related O<sub>3</sub> concentrations with non-event related concentration".

### Key Factor #1

To satisfy the key factor #1 for a Tier 2 demonstration, the estimated daily emissions of total tons per day of NOx and VOC divided by distance of the wildfires to the affected monitor (Q/D) is required. The Wildfire Ozone Guidance recommends that the Q/D value in tons per day per kilometer (tpd/km) should be greater than or equal to 100 tpd/km to satisfy a Tier 2 demonstration.

The AQMD used the BlueSky Playground tool 2.0 beta to estimate the emissions of NOx and VOCs emitted from seven fires in Northwest California on August 20, 2015. Emissions were estimated for August 20, 2015 instead of August 21, assuming the smoke plume from August 20 moved into the Reno area on August 21. See Figures 2.2 and 2.3 for satellite images showing the smoke plume moving into the Reno area on August 21.

The distance was identified by the closest perimeter of the Complex Fires on August 20, 2015 (178 km) and the total acres burned during August 20, were totaled (13,512 acres), using the aggregate approach described in the Wildfire Ozone Guidance. Using "Wildfire" as the emission type in the BlueSky Playground, "Very Dry" as the Fuel Moisture Conditions, FCCS Fuelbed #7 based on fuels information from Inciweb, average distance and totaled acreage burned on August 20, according to the BlueSky tool, the fires produced a total of 24,566 tons of NOx plus VOCs. This equates to an emissions/distance ratio (Q/D) of 86 tpd/km. Table 3.1 details the data used for the calculation of Q/D for August 20, 2015.

Since the dense smoke plume that impacted the Reno/Sparks area on August 20 did not dissipate completely, an additional Q/D test was evaluated summing the emissions from August 20 and 21. Using the same emission scenario described above for August 21, the BlueSky Playground tool determined emissions from August 21 produced 11,053 tons of NOx plus VOCs, equaling a Q/D of 39 tpd/km. Assuming the remaining smoke from the August 20 did not completely dissipate, the Q/D values were summed from August 20 and 21, equaling 125 tons/km for the two days. Table 3.2 shows the details of the calculation of Q/D for August 21, 2015.

The Q/D test, in this case, does not meet the criteria for Q/D > 100 for a single day. Because smoke never completely left the Reno/Sparks valley from August 19 and 20, it is safe to assume that NOx and VOCs emissions also accumulated in the valley, leading to a higher Q/D. The Wildfire Ozone Guidance suggests using Q/D as a screening tool for Tier 2; however, research has demonstrated that ozone production may increase with distance from the wildfire. Therefore, Q/D may not be the most accurate representation of  $O_3$  levels produced based on the distance from the wildfire.

Table 3.1: Q/D Calculations for Seven Northwest Wildfires on August 20, 2015

|                   |                | Distance |        | Emissions | Q/D      |

<sup>&</sup>lt;sup>1</sup> Jaffe and Widger, 2012. Ozone production from wildfires: A critical review. Atmospheric Environment 51,1-10

## Key Factor #2

A comparison of the event related  $O_3$  concentration with non-event related high  $O_3$  concentrations is required to satisfy the key factor #2 in a Tier 2 demonstration. Addressing key factor #2 involves demonstrating that the exceedance due to the event is either 1) in the  $99^{th}$  percentile (0.073 ppm) of the 5-year distribution of  $O_3$  monitoring data, or 2) is one of the four highest  $O_3$  concentrations within 1 year. As addressed in Section 2.2, the  $O_3$  exceedance on August 21, 2015 due to the wildfire events was the  $99^{th}$  percentile concentration of the 5-year distribution of  $O_3$  monitoring data (See Figures 3.1 and 3.2). Additionally, the  $O_3$  exceedance of 0.073 ppm is one of the four highest  $O_3$  concentrations of 2015. This event meets both criteria for key factor #2 and therefore supports the demonstration that the exceedance at the Reno3 monitor on August 21, 2015 was due to the exceptional event.

#### 3.4 Additional Tier 2 Evidence

In addition to providing the evidence of the key factors, the Wildfire Ozone Guidance requires additional evidence that the fire emissions were present at the altitude of the monitor. The Guidance requires at least one of the following pieces of evidence 1) photographic evidence of ground level smoke at the monitor, 2) concentrations of supporting measurements, or 3) evidence of changes in spatial/temporal patterns of  $O_3$  and/or NOx. The following subsections provide multiple pieces of evidence that emission from the wildfires affected the Reno3 monitor.

### **Trajectory Analysis**

This comprehensive weight of evidence includes documentation of the extensive nature of the fires by using the Hybrid Single-Particle Lagrangian Integrated Trajectory (HYSPLIT) model trajectories (both forward and backward) and NOAA's Hazard Management System smoke plume maps.

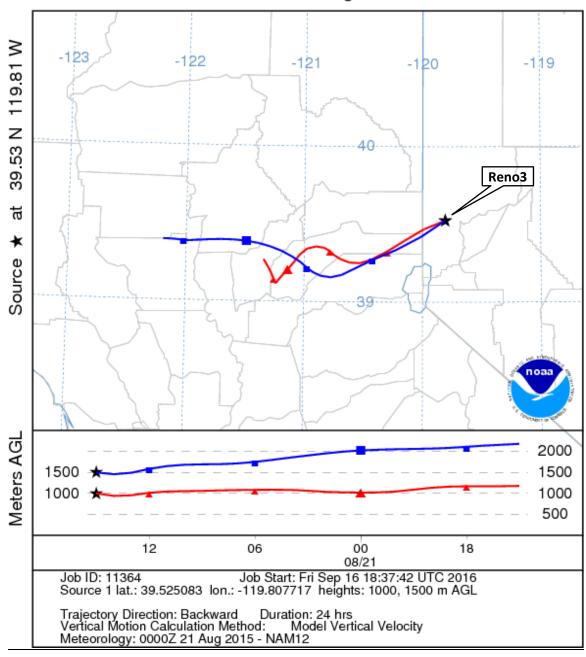

The HYSPLIT model computes simple air parcel trajectories. Its calculation method is a hybrid between the Lagrangian approach, which uses a moving frame of reference as the air parcels move from their initial location, and the Eulerian approach, which uses a fixed three-dimensional grid as a frame of reference. HYSPLIT backward trajectories show the path an air parcel took backward in hourly steps for a specified length of time. Applications include tracking the release of radioactive material, volcanic ash, and wildfire smoke.

Figure 3.4 shows the backward HYSPLIT trajectory and smoke plume for August 21, 2015 for 0800 PST. Ozone is already beginning to form at 0800 PST, and continues to increase throughout the day (see Appendix F for hour by hour backward trajectories for all of August 20 and 21). The map includes 24-hour backward trajectories at two different heights (1000 and 1500 meters) arriving at the Reno3 monitoring site with smoke density plume. The map also shows the monitoring stations east of the Complex Fires (Weaverville, Anderson, Chester, Quincy, Chico, and Grass Valley). Figure 3.5 shows the backward HYSPLIT model on August 21, 2015. The backward trajectories demonstrate that the dense smoke plume visible in Figure 2.2 on August 20, 2015 traveled across California, exacerbating PM<sub>2.5</sub> concentrations leading to an increase in O<sub>3</sub> concentrations in Washoe County on August 21, 2015.

California Weaverville Anderson Chico Reno3 Chester Quincy **Grass Valley** Sources; Esri, DeLorme, HERE, USGS, Interm#th/4ftorement P. Corp., NRCAN, Esri Japan, METI, Esri China (Hong Kong), Esri (Thailand), TomTom Legend 24-hr Backward Trajectories ending on 8/21/15, 1500 UTC (8/21, 8 am local time) WC Monitoring Sites Smoke Density Traj Heights w/ fire and smoke layers for 8/21/15 Hydrographic Area 87 - 1000 M Wildfires --- 1500 M Medium 0 10 20 40 Miles High

Figure 3.4: 24-Hour Backward HYSPLIT Trajectories and Smoke Plume on August 21, 2015

Figure 3.5: Backward Trajectory HYSPLIT Model on August 21, 2015

Additionally, forward trajectories were ran for August 20, 2015 at 0800 PST from six ambient monitoring stations east and southeast of the Complex Fires. These HYSPLIT trajectories, as seen in Figure 3.6, demonstrate that the height of the traveling smoke plume was too high to affect the monitoring stations southeast of the Complex Fires, and that the plume settled into HA87, impacting PM<sub>2.5</sub> and O<sub>3</sub> concentrations. Figures 3.7 through 3.12 show the HYSPLIT trajectories from each monitoring station identified in Figure 3.6 on August 20, 2015 at 0800 PST. These forward trajectories show that the dense smoke plume from August 20, 2015 traveled at a height greater than 1000 meters over the course of 24-hours and settled into HA87 on August 21, 2015. This is also supported by the satellite image in Figure 2.3 which shows the southern edge of the smoke moving up and over the Sierra Nevada Mountains toward HA87.

 $PM_{2.5}$  concentrations from the six ambient air monitoring stations identified in Figure 3.4 are listed in Table 3.2. This table identifies that the  $PM_{2.5}$  concentrations in the dense smoke plume traveled at a height over the southeast monitors, as identified by the lower concentrations at the monitoring sites at lower elevations east of the Complex Fires. Chester, which sits at an elevation of 1,381 meters, saw greater impacts from the smoke plume, with  $PM_{2.5}$  concentrations twice those of the lower elevation sites.

The trajectories and  $PM_{2.5}$  concentrations identifies that the dense smoke plume from the Complex Fires traveled at high elevations on August 20, 2015 and settled into HA87 beginning early on August 21, 2015, elevating  $PM_{2.5}$  and  $O_3$  concentrations monitored at the Reno3 during the mid-day period.

## Concentrations of Supporting Measurements

Figure 3.13 shows the elevated level of the 24-hour  $PM_{2.5}$  average on August 21, 2015 (indicated by the red triangle) as compared to 5-year historical concentrations.  $PM_{2.5}$  data in Figure 3.13 does not include data from the 2013 (Rim and American Fires) Exceptional Events Demonstrations submitted to the EPA. The 24-hour average  $PM_{2.5}$  concentration on August 21, 2015 is the  $100^{th}$  percentile during June through August 2011-2015 (excluding 2013 Exceptional Events  $PM_{2.5}$  concentrations) with a concentration of 38.8  $\mu$ g/m³.

#### PM<sub>2.5</sub> Speciation Data

The Reno3 site is part of the EPA's national Speciation Trends Network with an operating  $PM_{2.5}$  speciation sampler since 2001. The sampler is operating on the same schedule as the  $PM_{2.5}$  FRM, thereby allowing direct comparison between the two samplers for  $PM_{2.5}$  exceedance days. Elemental carbon (EC) and organic carbon (OC) are two of the many pollutants measured at the Reno3 Speciation site.

Organic carbon can be emitted directly from combustion activities or produced from secondary processes such as gas-to-particle formation. Elemental carbon, also known as light absorbing carbon or black carbon, is emitted directly from combustion sources. Increased summer background concentrations of OC in the western United States were regional by nature, likely due to the influence of biomass burning emissions. Conversely, summer background concentrations of EC due to impacts from biomass burning were higher in the urban areas.<sup>1</sup>

In Washoe County, speciation data from the Reno3 site supports the findings based on the research paper cited in reference 2 above. During the 2015 Wildfires, the highest OC concentration was in the 95<sup>th</sup> percentile for the previous 5 years of June through August data (2010-2014). The run day for the collected sample was on August 22, 2015. The 5-year June through August (2010-2014) median background concentration is 1.61  $\mu$ g/m³. Likewise, EC concentrations were also elevated into the 90<sup>th</sup> percentile during the 2015 California wildfires, as compared to the 5-year June through August (2014-2014) median background concentration of 0.36  $\mu$ g/m³. These statistics did not exclude data from the 2013 Rim and American Fires. Details of OC and EC background, and 2015 June through August concentrations are depicted in Figure 3.14. Table 3.2 lists the historical concentrations of OC and EC from 2010 to 2014, inclusive of concentrations affected by wildfires from California in August 2013.

Table 3.4: 2010-2014 (Jun, Jul, and Aug) Elemental & Organic Carbon Concentrations

|                  | Concentrations (µg/m <sup>3</sup> ) |        |        |         |  |  |
|------------------|-------------------------------------|--------|--------|---------|--|--|
|                  | Highest                             | Lowest | Median | Average |  |  |

### 4.0 CONCLUSIONS AND RECOMMENDATIONS

This demonstration package makes a compelling case that the unusually high  $O_3$  concentrations that led to the  $O_3$  exceedance on August 21, 2015 were due to the direct impacts of the 2015 California Wildfires. The demonstration also documents and provides analysis to support that the 2015 California Wildfires meets the criteria for an exceptional event and will allow for EPA to exclude the  $O_3$  data for August 21, 2015. The fires were not reasonably controllable or preventable due to the event being caused by lightning. Additionally, there is a clear and causal relationship between the smoke plumes from the fire and the measured exceedance in Washoe County. This relationship is demonstrated in Section 3.0. This demonstration package will have a regulatory impact on the 2015 8-hour  $O_3$  designation for Washoe County. Based on the information contained in this demonstration, EPA should be able to clearly identify the 2015 California Wildfires as an exceptional event in accordance with the EER and exclude the requested  $O_3$  data for August 21, 2015.

# APPENDIX A

# EPA 2015 ANNUAL NETWORK PLAN APPROVAL LETTER

#### UNITED STATES ENVIRONMENTAL PROTECTION AGENCY

#### **REGION IX**

75 Hawthorne Street San Francisco, CA 94105-3901

# OCT 2 1 2015

Mr. Daniel K. Inouye Chief, Monitoring and Planning Branch Air Quality Management Division Washoe County Health District P.O. Box 11130 Reno, Nevada 89520-0027

Dear Mr. Inouye:

Thank you for your submission of the Washoe County Health District's 2015 Ambient Air Monitoring Network Plan in July 2015. We have reviewed the submitted document based on the requirements set forth under 40 CFR 58. Based on the information provided in the plan, the U.S. Environmental Protection Agency (EPA) approves all portions of the network plan except those specifically identified below.

Please note that we cannot approve portions of the annual network plan for which the information in the plan is insufficient to judge whether the requirement has been met, or for which the information, as described, does not meet the requirements as specified in 40 CFR 58.10 and the associated appendices. EPA Region 9 also cannot approve portions of the plan for which the EPA Administrator has not delegated approval authority to the regional offices. Accordingly, the first enclosure (A. Annual Monitoring Network Plan Items where EPA is Not Taking Action) provides a listing of specific items of your agency's annual monitoring network plan where EPA is not taking action. The second enclosure (B. Additional Items Requiring Attention) is a listing of additional items in the plan that EPA wishes to bring to your agency's attention.

The third enclosure (C. Annual Monitoring Network Plan Checklist) is the checklist EPA used to review your plan for overall items that are required to be included in the annual network plan along with our assessment of whether the plan submitted by your agency addresses those requirements.

The first two enclosures highlight a subset of the more extensive list of items reviewed in the third enclosure. All comments conveyed via this letter (and enclosures) should be addressed (through corrections within the plan, additional information being included, or discussion) in next year's annual monitoring network plan.

We also want to thank you for your timely submission of the 2015 Ambient Air Monitoring Network Assessment for the Washoe County Health District, as required under 40 CFR Part

58.10. We recognize that preparing the network assessment was a significant project and we appreciate your effort.

The recently revised ozone NAAQS, finalized on October 1, 2015, includes language that revokes all existing seasonal ozone waivers upon the effective date of the final rule. EPA Region 9 will consider all previously approved ozone season waivers effective until December 31, 2015. In advance of the 2016 ozone monitoring season (January – December), EPA Region 9 recommends that agencies seeking new ozone waivers for the 2015 8-hour Ozone NAAQS of 0.070 ppm submit waiver requests no later than December 1, 2015.

If you have any questions regarding this letter or the enclosed comments, please feel free to contact me at (415) 947-4534 or Michael Flagg at (415) 972-3372.

Sincerely,

Meredith Kurpius, Manager Air Quality Analysis Office

#### **Enclosures:**

## A. Annual Monitoring Network Plan Items where EPA is Not Taking Action

We are not acting on the portions of annual network plans where either EPA Region 9 lacks the authority to approve specific items of the plan, or EPA has determined that a requirement is either not met or information in the plan is insufficient to judge whether the requirement has been met.

- Per 40 CFR 58.11(c), NCore, PAMS, and STN network design and changes are subject to approval of the EPA Administrator. Therefore, we are not acting on these items.
- EPA identified items in your agency's annual monitoring network plan where a requirement was not being met or information in the plan was insufficient to judge whether the requirement was being met based on 40 CFR 58.10 and the associated appendices. Therefore, we are not acting on the following items:

| Item                            | Checklist Row | Issue                             |
|---------------------------------|---------------|-----------------------------------|
| For low volume PM               | 17            | Insufficient information to judge |
| instruments (flow rate < 200    |               | •                                 |
| liters/minute), all other PM    |               |                                   |
| instruments are > 1 m from      |               | ·                                 |
| the lovol. If no, list distance |               |                                   |
| (meters) and instruments.       |               |                                   |
| Distance from supporting        | 78            | Not meeting requirement           |
| structure                       |               |                                   |

Additional information for each of these items may be found for the row listed in column 2, in the third enclosure (C. Annual Monitoring Network Plan Checklist).

## **B.** Additional Items Requiring Attention

- [Item 21] The minimum monitoring requirements for PM<sub>2.5</sub> are specified in 40 CFR 58 Appendix D 4.7.1(a) in terms of number of sites: "State, and where applicable local, agencies must operate the minimum number of required PM<sub>2.5</sub> SLAMS sites listed in Table D-5 of this appendix" not number of monitors. Please modify next year's ANP to present this requirement in terms of number of sites.
- [Item 22] There is a requirement for one continuous monitor per 40 CFR 58 Appendix D 4.7.2. There were three sites in 2014 with continuous PM<sub>2.5</sub> FEM monitors operating. Although there is information in this year's ANP demonstrating the requirement is met, it doesn't specifically discuss the requirement in 40 CFR 58 Appendix D 4.7.2. Please consider adding this to next year's plan, for example, in a footnote or paragraph following Table 4.

#### C. ANNUAL MONITORING NETWORK PLAN CHECKLIST

(Updated October 1, 2015)

Year: 2015

Agency: Washoe County Health District Air Quality Management Division (AQMD)

40 CFR 58.10(a)(1) requires that each Annual Network Plan (ANP) include information regarding the following types of monitors: SLAMS monitoring stations including FRM, FEM, and ARM monitors that are part of SLAMS, NCore stations, STN stations, State speciation stations, SPM stations, and/or, in serious, severe and extreme ozone nonattainment areas, PAMS stations, and SPM monitoring stations.

40 CFR 58.10(a)(1) further directs that, "The plan shall include a statement of purposes for each monitor and evidence that siting and operation of each monitor meets the requirements of appendices A, C, D, and E of this part, where applicable." On this basis, review of the ANPs is based on the requirements listed in 58.10 along with those in Appendices A, C, D, and E.

EPA Region 9 will not take action to approve or disapprove any item for which Part 58 grants approval authority to the Administrator rather than the Regional Administrators, but we will do a check to see if the required information is included and correct. The items requiring approval by the Administrator are: PAMS, NCore, and Speciation (STN/CSN).

Please note that this checklist summarizes many of the requirements of 40 CFR Part 58, but does not substitute for those requirements, nor do its contents provide a binding determination of compliance with those requirements. The checklist is subject to revision in the future and we welcome comments on its contents and structure.

## Key:

| White  | meets the requirement   |
|--------|---|
| Yellow | requirement is not met, or information is insufficient to make a determination. Action requested in next year's plan or outside the ANP |
|        | process (items listed in Enclosure A).  |
| Green  | item requires attention in order to improve next year's plan (items listed in Enclosure B).   |

### **Public Comments on Annual Network Plan**

Were comments submitted to the S/L/T agency during the public comment period?

No

If no, skip the remaining questions.

If yes:

- Were any of the comments substantive?
  - o If yes, which ones?
  - o Explain basis for determination if any comments were considered not substantive:
- Did the agency respond to the substantive comments?
  - o If yes, was the response adequate?
- Do the substantive comments require separate EPA response (i.e., agency response wasn't adequate)?
- Are the sections of the annual network plan that received substantive comments approvable after consideration of comments?
  - o If yes, provide rationale:

### APPENDIX B

### 2015 DATA CERTIFICATION LETTER

April 22, 2016

Deborah Jordan Air Division Director U.S. EPA Region 9 75 Hawthorne Street, AIR-1 San Francisco, CA 94105

Re: CY2015 Ambient Air Monitoring Data Certification

Dear Ms. Jordan:

Attached please find a copy of the Washoe County Health District, Air Quality Management Division's (AQMD) AQS AMP600 Data Certification Report and AMP450NC Quick Look summary report for ambient air monitoring data for all State and Local Air Monitoring Stations (SLAMS) and Special Purpose Monitors (SPMs) which meet criteria in 40 CFR 58 Appendix A operated from January 1 to December 31, 2015. Included is data from Federal Reference Method (FRM) and Federal Equivalent Method (FEM) monitors for CO, NO/NO<sub>x</sub>/NO<sub>2</sub>, ozone, PM<sub>10</sub>, PM<sub>10-2.5</sub>, PM<sub>2.5</sub>, and SO<sub>2</sub> (hourly and 5-minute average data).

Please note that the  $SO_2$  data at the Reno 3 monitoring station (EPA ID 32-031-0016) was only 71% (hourly) and 68% (5-minute) complete for October - December (4th Quarter) 2015. An AQS AMP430 Data Completeness Report summarizing this issue is also attached. The  $SO_2$  analyzer initially failed in August 2015 with a bad UV lamp driver board. AQMD staff replaced UV lamp driver board, but problems with an unstable zero caused two weekly precision check failures in November 2015, invalidating two full weeks of data. After numerous zero adjustments and a full PMT factory calibration, one more week of data was lost in December 2015. AQMD staff replaced the failing  $SO_2$  analyzer in January 2016.

This letter certifies that the ambient concentration data and the quality assurance data are completely submitted to AQS (with the exception of the note above), and the ambient data are accurate to the best of my knowledge taking into consideration the quality assurance findings.

Please contact me or Craig Petersen at (775) 784-7200 with any questions or concerns.

Sincerely,

Daniel Inouve

Branch Chief, Monitoring and Planning

Daniel Inouge

CERTIFICATION EVALUATION AND CONCURRENCE FLAG MEANINGS

| LAG | MEANING  |
|-----|--|
| I   | The monitoring organization has revised data from this monitor since the       |
|     | most recent certification letter received from the state.                      |
| 1   | The certifying agency has submitted the certification letter and required      |
|     | summary reports, but the certifying agency and/or EPA has determined           |
|     | that issues regarding the quality of the ambient concentration data cannot     |
|     | be resolved due to data completeness, the lack of performed quality            |
|     | assurance checks or the results of uncertainty statistics shown in the         |
|     | AMP255 report or the certification and quality assurance report.               |
| S   | The certifying agency has submitted the certification letter and required      |
|     | summary reports. A value of "S" conveys no Regional assessment regarding       |
|     | data quality per se. This flag will remain until the Region provides an "N" or |
|     | "Y" concurrence flag.  |
| J   | Uncertified. The certifying agency did not submit a required certification     |
|     | letter and summary reports for this monitor even though the due date has       |
|     | passed, or the state's certification letter specifically did not apply the     |
|     | certification to this monitor.   |
| X   | Certification is not required by 40 CFR 58.15 and no conditions apply to be    |
|     | the basis for assigning another flag value                                     |
| Y   | The certifying agency has submitted a certification letter, and EPA has no     |
|     | unresolved reservations about data quality (after reviewing the letter, the    |
|     | attached summary reports, the amount of quality assurance data                 |
|     | submitted to AQS, the quality statistics, and the highest reported             |
|     | concentrations).   |
|     |  |

Note: The  $\star$  indicates that the mean does not satisfy summary criteria.

### **APPENDIX C**

### **EXCEPTIONAL EVENT INITIAL NOTIFICATION**

### Initial Notification of Potential Exceptional Event Information Summary

Submitting Agency: Washoe County Health District, Air Quality Management Division

Agency Contact: Daniel Inouye, Branch Chief

Date Submitted: June 3, 2016

Applicable NAAQS: 2006 24-Hour PM<sub>2.5</sub> and 2015 8-Hour Ozone

Affected Regulatory Decision<sup>1</sup>: Attainment of the 2015 8-Hour Ozone NAAQS

Area Name/Designation Status: Washoe County Attainment Area

Design Value Period: 2013-2015

Narrative: On August 18, 2015 smoke from numerous wildfires in the Northwest portion of California impacted the Reno/Sparks area. The smoke impacts contributed to several exceedances of the National Ambient Air Quality Standards (NAAQS) for Particulate Matter less than or equal to 2.5 microns in aerodynamic diameter (PM<sub>2.5</sub>) and Ozone (O<sub>3</sub>) at several sites in the Washoe County Health District, Air Quality Management Division's (AQMD) monitoring network. The AQMD requests that the Regional Administrator for Region IX of the U.S. Environmental Protection Agency (EPA) accepts this Initial Notification so an Exceptional Events Demonstration document can be prepared to petition for the exclusion of the air quality monitoring data effected from these fires from the normal planning and regulatory requirements under the Clean Air Act (CAA) in accordance with the Exceptional Events Rule (EER).

Table A (1): Information specific to each flagged site day that may be submitted to EPA in support of the affected regulatory decision listed above.

|            |                      | Type of Event (high wind, volcano, |          |             |     |           |                   |

### APPENDIX D

### PUBLIC INSPECTION PLAN

A public notice was published in the Reno Gazette-Journal on October 1, 14 and 27, 2016 notifying the public that the Draft 2015 California Wildfire Exceptional Events Demonstration was available for public comment from October 1 through October 31, 2016. A hard copy was available at the AQMD office and on the website (OurCleanAir.com). The AQMD did not receive any public comments during the public comment period.

Notice of Proposed Action by the Washoe County Health District
Air Quality Management Division
PUBLIC NOTICE

Air Quality Management Division PUBLIC MOTICE

EPA allows data that have been directly influenced by exceptional and/or natural events (i.e., wildfires) to be excluded in the determination of exceedances and National Ambient Air Quality Standards violations for State Implementation Plan purposes. Pursuant to 40 CFR 50.14(c/3Xii), the Washoe County Health District, Air Quality Management Division (AQMD) is soliciting comments on its final demonstrations of the 2015 California Wildfires that caused elevated concentrations of 03 and PM2.5 throughout Washoe County, Nevada and AQMD's decision to flag this episode based on these analyses. A copy of the exceptional events package is available for review beginning October 1, 2016 at the AQMD website (OurCleanAir.com) and office at 1001E. 9th Street, Suite B171, Reno, NY 89512. Interested parties can submit written comments throughout the comment period which will end on October 31, 2016. Any comments received will be considered and forwarded to EPA with the final exceptional events package. Comments should be addressed, faxed, or enailed to: Daniel Inouye, Monitoring and Planning Branch Chief, Washoe County Health District, Air Quality Management Division, P.O. Box 11130, Reno, NY 89520;FAX:(775)784-7225,EMAIL.dinouye@washoecounty.us.

Washoe County air quality is unhealthy this morning because of smoke from nearby fires: http://bit.ly/1HZPNFW

#BESMOKESMART "NEW INFO": Washoe schools must cancel or move activities indoors Friday afternoon because "unhealthy" air quality conditions. Officials say there's no word on whether or not any schools have made cancellations. GET the latest in air quality news here at MyNews4.com.

Washoe schools must cancel or move activities indoors due to poor air quality

According to Washoe County School District spokesperson Victoria Campbell, area schools' outdoor activities may be canceled or moved indoors Friday...

WWW.MYNEWS4.COM | BY SINCLAIR BROADCAST GROUP

SMOKE & HAZE: Air Quality in Reno-Sparks is in the Unhealthy for Sensitive Groups range this morning with wildfire smoke across the region.

MYNEWS4.COM

#AirQualityAlert The Air Quality Management Division sent out an alert Friday morning saying air quality has reached unhealthy levels for sensitive groups in Washoe County.

Smoke and haze from fires burning in California and across the Pacific Northwest continue to drift into the region.

People sensitive to air quality should limit outdoor activity until air quality improves. ... See More

#### Air Quality Has Reached Unhealthy Levels in Washoe County

Just before 8:00 a.m. Friday the Washoe County Air Quality Management Division sent out an alert saying air quality had reached 'unhealthy' levels.

The dense smoke coming into Nevada from the northern California Fires will continue to plague...

MIKEALGER.NET

This is what it looks like outside right now. Not much to see beyond the Grand Sierra Resort. Hazy skies will likely continue over the next few days. It's best to stay indoors if you are sensitive to the unhealthy air. The Washoe County School District says schools can decide to either cancel all outdoor practices, or move activities indoors. School recesses will be assessed on a site-by-site case.
